ABSTRACT

A system for accessing information from data sources. A user domain translates
queries from users and applications for recognition by an aggregation domain, receives
responses from the aggregation domain, and translates the responses for recognition by the
users and applications. An aggregation domain receives translated queries from the user
domain, translates the queries for recognition by a data source domain, receives responses
from the data source domain, translates the responses for recognition by the user domain, and
transmits the translated responses to the user domain. A data source domain receives the
translated queries from the aggregation domain, identifies data sources to receive the queries
translates the queries to the data sources, receives responses from the data sources, translates
the responses, and transmits the translated responses to the aggregation domain. A knowledge
base the domains use to automatically function includes data models and conceptual
terminology translations.
